Abstract

Elasto-Gel[™], as a glycerine-based hydrogel, obviously fulfills the proposed criteria for an ideal wound dressing. Nevertheless, its range of indications has not yet been settled.

That was why we applied *Elasto-Gel*[™] not only in the treatment of a variety of wounds, especially venous leg ulcers, diabetic ulcers, pyoderma gangraenosum, trophic ulcers due to rheumatic arthritis and defects after cryotherapy of plantar warts, but we also used *Elasto-Gel*[™] in the management of keloid scars, hyperkeratotic lesions and localized scleroderma.

In our experience, the preliminary results were encouraging and larger, controlled, randomized clinical studies are needed to confirm these promising findings.
